

Six criteria say forecasting instrument. The seventh reaches the customer.

The facets are the market-efficiency literature's, not ours. Only the last one - what the house takes - matches what a sportsbook does, and it is the only one a participant feels.

CRITERION	IF THIS WERE A GAMBLING PRODUCT	WHAT THE DATA SHOW
Calibration	— prices systematically biased	— well calibrated at every venue (ECE 0.009-0.014)
Favourite-longshot bias	— longshots systematically overpriced	— none: every calibration-slope CI includes 1
Information content	— no forecasting value	— beats a public-statistics floor by 13e-3 (z~7.3)
Internal coherence	— ladders contradict themselves	— 99.7% monotone on live books; executable arbitrage 0.10%
Distributional accuracy	— the shape of outcomes is wrong	— margin PIT passes in every league; totals in 3 of 4
Exploitability	— a profitable strategy exists	— no strategy clears costs; edge-chasing loses more
What the house takes	— a large, unavoidable take	— 4.2% all-in for a taker - the same as a sportsbook
