

The venues are equivalent inside the band where a difference could reach anyone

Pre-stated $\delta = 1.0 \times 10^{-3}$, fixed in July before these comparisons. The bands are what a 4.2% taker cost makes unmonetisable.

rigor.log, sharp_books.log · $\Delta \text{Brier} = \varepsilon^2$, so $\delta = 1.0 \times 10^{-3}$ tolerates a systematic 3.16pt error, not 0.5pt · a red bar reports the measurement's power, not a gap between venues.
